

Integrating AI into our Solution (Day 3 CINB Governance hack)

There will be a station across the 36 State and the FCT, drones will be stationed there.

Any project listed will have a verification badge, after the project has been verified.

Verification will be done by sending a drone to view the project at the stated location. The coordinates of the place will be stored and a verification badge will be displayed on the project if it has been confirmed.

If a project is moved to the abandoned category due to inactivity, the program will trigger a drone to visit the location that has been stored with the project. We will be able to get latest update about the project.

If a picture or video is posted as an update or citizen's feedback, the AI in place will verify the Geo location information on the picture or video to make sure the information corresponds with the location of the project to avoid misinformation or fake information.

This will go along in preventing assault or undue interference in Tracking Projects. Integrating AI and Data Science will also reduce need for Manpower in Project Tracking.
